

## Chapter 18 Presenting Data

18A was mostly just learning the viewing tools when you are working in layout mode. 18B was adding a X – Y information, which in this case was latitude and longitude. In fact this was typhoon data that would be used in the final exercise.

We start with a typhoon of the Philippines, which is represented first by green and black circles. Then the symbology is changed to the universal typhoon symbol. Then a black line to show its path, which is changed to the gold color. Finally a date and time symbol that includes the speed information.

This work was saved as a .emf file as you can see below so it could be added to a powerpoint presentation.
